

**ОТЧЕТ**

about the conducted testing by the method  
"vegetative resonance test"

1. Minsk :

November 1, 2002

In the period from 16.10.02 to 30.10.02, the Belarusian State University Republican Center for Human Problems (RCHR) conducted a study on the effect of personal computer (PC) radiation on the human body and neutralization of this effect after installing a Neutronic protective device on a PC.

The study was conducted using the method of "targeted resonance test" (ART) on the aplate software package "IMEDIS" (certificate no . 39/23 - 506 - 94 Committee on New Medical Equipment of the Russian Federation; certificate of compliance with the State Standard of Russia No. ROSS RU IMO 2.IN 2009. Registered in the State Register i0.01.96).

The testing was carried out by the bioresonance therapy doctor of the RCHR Birilo I.G. on 4 PC operators of the LO installation and i4 days after the installation of the Neutronic device on the PC.

Initial testing showed the presence of electromagnetic load of the 2nd degree and the influence of electromagnetic force fields on 3 PC operators. During the final testing, the electromagnetic burden and the influence of electromagnetic force fields are not determined by the ART method

**CONCLUSION:** Testing has shown that the Neutronics device eliminates electromagnetic stress on PC operators and the influence of electromagnetic force fields on them.

The Director of the RCHR.  
Candidate of Physical and Mathematical Sciences
