G. Dzerzhinsk

The State Sanitary and Epidemiological Supervision Center in Dzerzhinsk, Nizhny Novgorod Region reviewed the submitted documents for the NEUTRONIK device, designed to protect the population from the effects of electromagnetic radiation emanating from computer monitors, televisions, and cell phones, developed by ANO Valkon Center (Russia, Moscow region, Zhukovsky).

Neutronik has been tested and approved for use in the course of scientific and practical work of the Quantum Vega Eniological Center jointly with the F.F. MNIG.Erisman (report dated 12.01.2000).

Neutronics has shown high efficiency in the work carried out by the Institute of Biophysics of the Ministry of Health of the Russian Federation (report dated 06/25/2000).

Neutronik passed the examination at the All-Russian Scientific Research Institute of Certification (examination No. 101cc/1002 dated 08/14/2000)

Neutronics has been tested in the laboratories of hygienic studies in Riga and Tashkent.

According to the test reports, this device really reduces the area of exposure to the electromagnetic field from computers, televisions, and cell phones.

In addition, the testing laboratory of the State Institution of the Central Research Institute in Dzerzhinsk (Certificate of accreditation No. ICEN. RU.TSOA.034.12 No. ROSS.RU .0001 5III15 dated 05.01.98) measurements of the electric magnetic field from the monitors of 2 computers without a protective device and with a protective device "Neutronics" with different exposures in time and

distance were carried out.

The measurements were carried out with the VE-METER-AT-002 device (certificate of verification No. 2387/2000 dated 08/28/2000).

The research results showed that there is a decrease in the electromagnetic field by 30-45% at a distance of 5 cm from the screen after a two-day exposure.

The effect of reducing electromagnetic field radiation depends on the brand of computers, TV monitors and the exposure time of the Neutronics on the monitor body.

Taking into account the above and the results of measurements of the electromagnetic field, the State Institution "Center of State Sanitary and Epidemiological Supervision in Dzerzhinsk, Nizhny Novgorod region" believes that the use of the Neutronics device makes it possible to repeatedly reduce the radiation of the electromagnetic field from a computer, TV and cell phone, causing serious disorders in the immune and nervous systems of the human body, which leads to pathological changes in the human body.
